View data behind layers

To view the data corresponding to any of the project layers you can right click on the layer element that you want to inspect in the Layer Panel and select the option “Open Attribute Table”.

From there you can view the data in a table like form.

If you choose the “Properties” option after right clicking on a layer element then you will be able to change all the options of that layer. You can also double click on the element in the Layer Panel to open its properties form.
